Enrollment Viewer

Event Viewer can:
List a learner's historical enrollments
View details (per-lesson progress) of enrollment
All views are real-time (through websockets)

Event Viewer should have a sticky position to the top half of the viewport and must occupy at least half of the viewport.

{learner_id}

Learner profile is rendered at the top right of the enrollment manager. There should be an interface (like dropdown) to allow swapping between learners

Web Page is essentially a single-page app (SPA) implemented with either javascript or web assembly.

The SPA is hosted at /.

Scenario Player

Scenario Player should have a look and feel of a playback control bar of a media player with the following elements:
Play/Pause
Stop
Next
Progress Bar
Playlist (where each "track" is either the event object dictated in events.json that is sent to the service for ingestion or an action like enroll or upsert_path. Note and expect actions should not be included. Each scenario has its own "playlist")
Playback speed, an integer counter from 1 - 5 that dictates how many seconds the playlist must wait before send the next track to the service

Scenario Player should have a sticky position to the bottom half of the viewport and must occupy the least amount of screen as possible.
